

Establishing and Monitoring Stream Stabilization Practices for Water Quality Enhancement

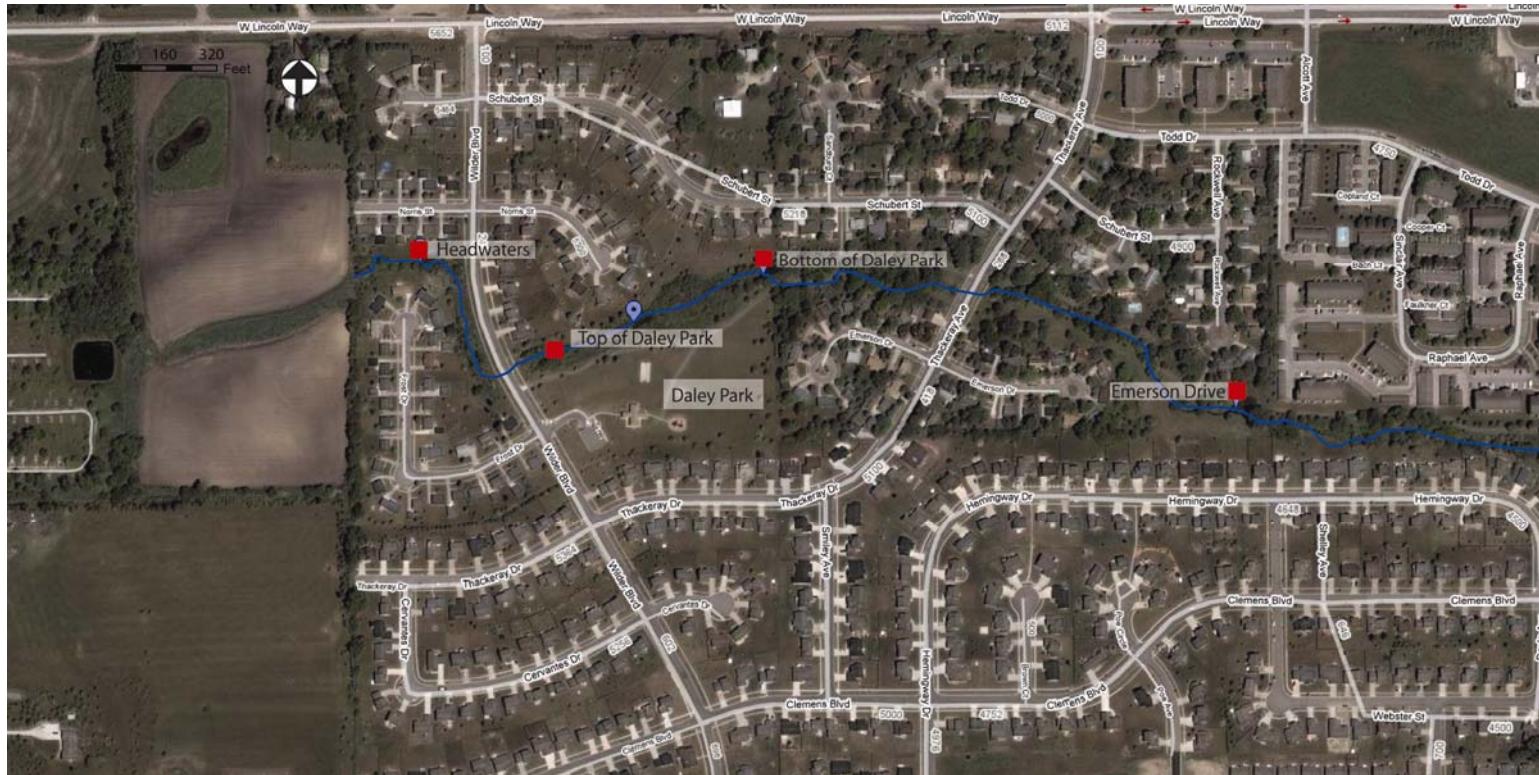

Surface Water Quality Monitoring Final Report

College Creek 2008 – 2010
City of Ames

Four sample sites in the WIRB project area were monitoring seasonally for the three grant years (see map below). Sample sites (from upstream to downstream) include:

- Headwaters site – slightly downstream of rural tile drain; also the location where College Creek first becomes an open channel
- Top of Daley Park site – slightly east of intersection of Wilder Avenue and College Creek; also the upper end of the Daley Park wetland
- Bottom of Daley Park site – slightly east and downstream of the Daley Park wetland area
- Emerson Drive site – East of Thackeray and behind Emerson Drive and Rockwell Circle

Samples were collected and analysis on a near-monthly basis for the duration of the WIRB grant. Samples were not collected during the 2010 summer construction duration. Monitoring included: total phosphorus, ortho phosphorus, total nitrogen, ammonia, total suspended solids, alkalinity, coliform bacteria, E. coli bacteria, pH, and dissolved oxygen. Table results for each pollutant are included as well as graphs for total phosphorus, ortho phosphorus, total nitrogen, E.coli, pH, and dissolved oxygen. Graphed pollutants are compared to established standards as noted.

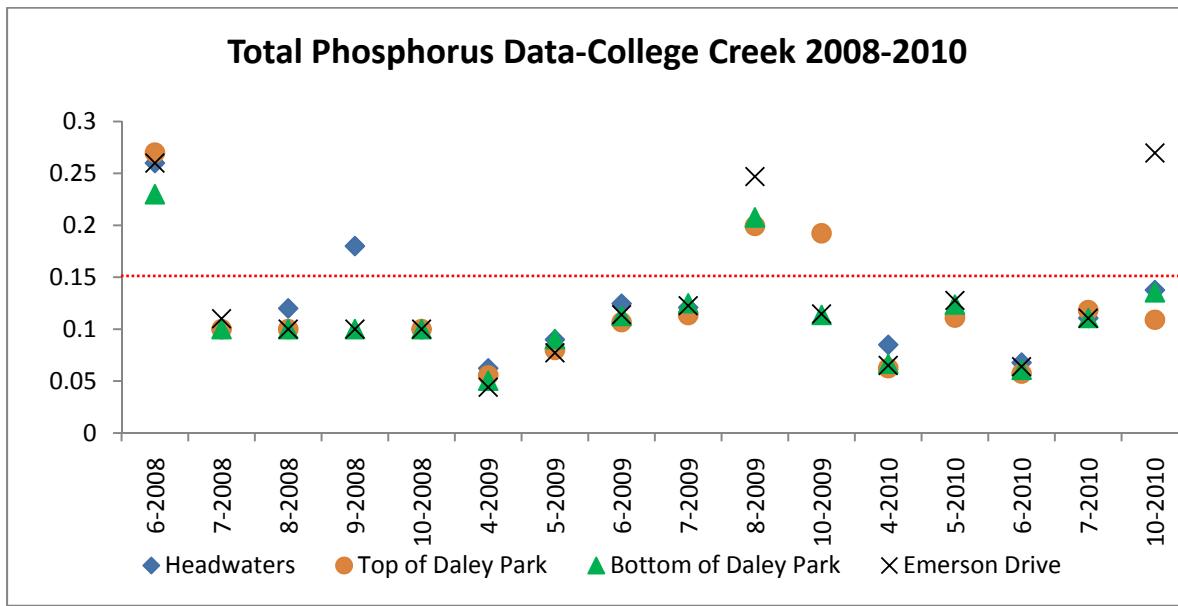

College Creek Monitoring Site Map (2008 – 2010).
